## Cystein Protease Inhibitors

This invention relates to derivatives of alpha-amino acid amides, to pharmaceutical compositions containing such  
5 compounds, and to their use in medicine as inhibitors of cysteine proteases, particularly the cathepsins.

### Background to the Invention

The cathepsin family (C1) of lysosomal cysteine (or thiol)  
10 proteases is a subset of the papain superfamily (clan CA of cysteine proteases) and includes cathepsin B, H, K, S, L and the recently discovered cathepsins O, O2/K, V, X, Z and W (lymphopain). Related enzymes also regarded as  
15 cysteine proteases are the cytoplasmic  $\text{Ca}^{2+}$  dependent calpains (family C2). Cysteine proteases are classified both functionally and according to the nature of their active site, which has a thiol residue. They differ in substrate specificities and other enzymatic activities, these differences probably arising from evolutionary  
20 divergence.

The known cathepsins are synthesized on membrane bound ribosomes, transferred to the endoplasmic reticulum, then to the Golgi apparatus and finally to the lysosome and  
25 endosomes. They have an important function in regulation of intracellular protein metabolism, mobilisation of tissue proteins and conversion of proenzymes, prohormones and neuropeptides into biologically active molecules. The cathepsins are believed to be involved in a number of  
30 diseases.

Cathepsin K can be secreted into the extracellular space and is involved in bone and cartilage remodelling. Cathpsin K is implicated in the pathogenesis of osteoporosis. Cathepsin K inhibitors can prevent  
5 osteoporosis in animal models (PNAS.1997. 94:14249-14254). Cathepsin L inhibitors have also been shown to inhibit osteoporosis (Bone, 1997. 20:465-471).

Cathepsin B and other cysteinyl cathepsins have also been  
10 shown to be released extracellularly by various tumour cells and are thought to play a role in tumour invasion (Journal of cellular Physiology. 1992. 150:534-544).

The cysteinyl cathepsins have also been shown to play a  
15 role in rheumatoid arthritis (Arthritis and Rheumatism 1994. 37:236-247) and neuronal and cardiac ischaemia (European Journal of Neuroscience. 1998. 10.1723-1733).

Cathepsins S and L both play a role in the generation of  
20 free MHC class II molecules capable of binding antigenic peptides in the endosomes. These class II/peptide complexes move to the cell membrane and are involved in T lymphocyte activation. Inhibitors of Cathepsin S have been shown to inhibit allergic immune responses (Journal of  
25 Clinical Investigation. 1998. 101:2351-2363).

In addition to their role in the above diseases, cysteinyl cathepsins play a major role in the pathogenesis of infectious diseases. For example, cysteinyl cathepsins are  
30 used by the protozoal parasites Plasmodium (malaria) and Trypanosoma (Chagas Disease) to invade the human host and

cysteinyl cathepsin inhibitors can inhibit experimental disease in both cases (Antimicrobial agents and chemotherapy. 1998. 42:2254-2258; Journal of Experimental Medicine. 1998. 188:725-734). Cysteinyl cathepsins are  
5 also virulence factors for several pathogenic bacteria.

A recent review (Annu. Rev. Physiol. 1997. 59:63-88) describes the state of the art of cysteine proteases, including the cathepsins, and their presumed biological  
10 functions. Other reviews deal with cathepsin B inhibitors as potential anti-metastatic agents (Exp. Opin. Ther. Patents, 1998, 8: 645-672), and cathepsin K inhibitors as potential treatments for osteoporosis (Exp. Opin. Ther. Patents, 1999, 9: 683-644).

15

International patent applications WO 96/32408, WO 98/12176, WO 98/12210 and GB 9806287.0 describe, inter alia, classes of cysteine protease inhibitors which may be represented by formula (IA):

25 Compositions with which the invention is concerned may be  
prepared for administration by any route consistent with  
the pharmacokinetic properties of the active  
ingredient(s).

30 Orally administrable compositions may be in the form of  
tablets, capsules, powders, granules, lozenges, liquid or

gel preparations, such as oral, topical, or sterile parenteral solutions or suspensions. Tablets and capsules for oral administration may be in unit dose presentation form, and may contain conventional excipients such as binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, or polyvinyl-pyrrolidone; fillers for example lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tableting lubricant, for example magnesium stearate, talc, polyethylene glycol or silica; disintegrants for example potato starch, or acceptable wetting agents such as sodium lauryl sulphate. The tablets may be coated according to methods well known in normal pharmaceutical practice. Oral liquid preparations may be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, for example sorbitol, syrup, methyl cellulose, glucose syrup, gelatin hydrogenated edible fats; emulsifying agents, for example lecithin, sorbitan monooleate, or acacia; non-aqueous vehicles (which may include edible oils), for example almond oil, fractionated coconut oil, oily esters such as glycerine, propylene glycol, or ethyl alcohol; preservatives, for example methyl or propyl p-hydroxybenzoate or sorbic acid, and if desired conventional flavouring or colouring agents.

For topical application to the skin, the active ingredient(s) may be made up into a cream, lotion or

ointment. Cream or ointment formulations, which may be used for the drug, are conventional formulations well known in the art, for example as described in standard textbooks of pharmaceuticals such as the British Pharmacopoeia.

The active ingredient(s) may also be administered parenterally in a sterile medium. Depending on the vehicle and concentration used, the drug can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as local anaesthetic, preservative and buffering agents can be dissolved in the vehicle. Intravenous infusion is another route of administration for the compounds.

Safe and effective dosages for different classes of patient and for different disease states will be determined by clinical trial as is required in the art. It will be understood that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

Scheme-2

In the above processes, the reactants are reacted together with solvent at elevated or low temperatures for sufficient time to allow the reaction to proceed to completion. The reaction conditions will depend upon the nature and reactivity of the reactants. Depending on the reactants, a solvent will generally be selected from the group consisting of benzene, toluene, acetonitrile, tetrahydrofuran, ethanol, methanol, chloroform, ethyl acetate, methylene chloride, dimethyl formamide, dimethyl sulfoxide, hexamethyl phosphoric triamide, water, pyridine, acetone and the like. Solvent mixtures may also be utilized.

Reaction temperatures generally range from between -70 °C to 150 °C. The preferred molar ratios of reactants are 1:1 to 5. The reaction time range from 0.5 to 72 hours, depending on the reactants.

### Biological Example

Testing of inhibitors for inhibition of cathepsin B, L, K  
and S.

25

#### In vitro assay procedure for cathepsin B

The compounds of formula I were tested for inhibition  
of cathepsin B using the known method (A.J. Barret et al.,  
Biochem. J. 1982, 201, 189-198). To a 170 µl of enzyme-  
30 buffer mixture (enzyme: r rat cathepsin B; diluted to  
give approximate 10 F units/min, buffer: 56 mM sodium

acetate, 1.124 mM EDTA, 10 mM DTT, pH 5.1) a 10  $\mu$ L of inhibitor (dissolved in DMSO) was added. After 10 min of incubation at room temperature, a 20  $\mu$ l of 5 mM substrate (N-CBZ-Phe-Arg-AMC, dissolved in DMSO) was added to  
5 initiate reaction. Reading is followed up for 10 min at the fluoroscan reader (excitation at 380 nm emission at 460 nm).

A plot of percentage of inhibition vs inhibitor concentration is obtained, and  $IC_{50}$  is determined using a  
10 linear regression calculations (concentration of inhibitor which will give 50% inhibition).

#### In vitro assay procedure for cathepsin L

To a 170  $\mu$ l of enzyme-buffer mixture (enzyme: r rat  
15 cathepsin L, diluted to give approximate 15 F units/min, buffer: 58.8 mM sodium citrate, 1.18 mM EDTA, 235 mM sodium chloride, 5 mM DTT, pH 5.0) a 10  $\mu$ L of inhibitor (dissolved in DMSO) was added. After 10 min of incubation at room temperature, a 20  $\mu$ l of 1 mM substrate (N-CBZ-Phe-  
20 Arg-AMC, dissolved in DMSO) was added to initiate reaction. Reading is followed up for 10 min at the fluoroscan reader (excitation at 380 nm emission at 460 nm).

A plot of percentage of inhibition vs inhibitor  
25 concentration is obtained, and  $IC_{50}$  is determined using a linear regression calculations (concentration of inhibitor which will give 50% inhibition).

#### In vitro assay procedure for cathepsin K

30 To a 170  $\mu$ l of enzyme-buffer mixture (enzyme: r cathepsin K, diluted to give approximate 30 F units/min,

buffer: 100 mM sodium acetate, 5 mM EDTA, 20 mM L-cysteine, 0.01% Brij, pH 5.5) a 10  $\mu$ L of inhibitor (dissolved in DMSO) was added. After 10 min of incubation at room temperature, a 20  $\mu$ L of 2.7 mM substrate (N-CBZ-Phe-Arg-AMC, dissolved in DMSO) was added to initiate reaction. Reading is followed up for 10 min at the fluoroscan II plate reader (excitation at 380 nm emission at 460 nm).

A plot of percentage of inhibition vs inhibitor concentration is obtained, and  $IC_{50}$  is determined using a linear regression calculations (concentration of inhibitor which will give 50% inhibition).

#### In vitro assay procedure for cathepsin S

To a 170  $\mu$ L of enzyme-buffer mixture (enzyme: r cathepsin S, diluted to give approximate 30 F units/min, buffer: 100 mM sodium phosphate, 1 mM EDTA, 5 mM DTT, 0.01% Brij, pH 6.5) a 10  $\mu$ L of inhibitor (dissolved in DMSO) was added. After 10 min of incubation at room temperature, a 20  $\mu$ L of 1.2 mM substrate (N-CBZ-Val-Val-Arg-AMC, dissolved in DMSO) was added to initiate reaction. Reading is followed up for 10 min at the fluoroscan II plate reader (excitation at 380 nm emission at 460 nm).

A plot of percentage of inhibition vs inhibitor concentration is obtained, and  $IC_{50}$  is determined using a linear regression calculations (concentration of inhibitor which will give 50% inhibition).
